

Day 4 – Assignment

Instructions:

1. Complete each task step-by-step in Xcode using SwiftUI.
2. Test your code using live previews or by running your app on an iOS simulator.

Part A: SwiftUI Basics & Modifiers

Task 1

- Create a SwiftUI view that displays a welcome message using a text component.
- **Hint:** Use the `Text("Your Message")` view inside your body.

Task 2

- Modify a `Text` view to change its font size, make the text bold, and alter its text color using modifiers.
- **Hint:** Use modifiers like `.bold()`, and `.foregroundColor(.red)`.

Task 3

- Display an icon on the screen using Apple's SF Symbols library.
- **Hint:** Use `Image(systemName: "star.fill")` to load built-in system symbols.

Part B: Layouts & Assets

Task 4

- Arrange a text view vertically, one below another, using a stack layout container.
- **Hint:** Place your text views inside a `VStack { ... }` container.

Task 5

- Place two text labels side by side in a single horizontal row using a layout container.
- **Hint:** Wrap your text components inside an `HStack { ... }` container.

Task 6

- Add an image from your local asset catalog to your SwiftUI view.
- **Hint:** Import your image into `Assets.xcassets` and load it using `Image("YourImageName")`.

Task 7

- Add a button to your SwiftUI view and customize its text color using a foreground color modifier.
- **Hint:** Create a `Button("Click Me") { }` and apply `.foregroundColor(...)` to style the text.

Part C: Custom Views & Screen Styling

Task 8

- Change the background color of your screen or container box (like a `VStack`) to a custom color.
- **Hint:** Add `.background(Color.yellow)` or any color modifier to your container.

Task 9

- Add a new SwiftUI View file named `HomeScreen`, display a welcome text inside it, and run the project.
- **Hint:** Right-click your project folder, create a new SwiftUI view file, name it `HomeScreen`, and call it or preview it.

Task 10

- Add a nice shadow effect or rounded corners to a view to make it look like a card.
- **Hint:** Add `.cornerRadius(10)` for rounded corners or `.shadow(radius: 5)` for a shadow effect on your view.
